## I. Initial Login to the Switch Web Management Interface

1. The default management ip of SKS8300-8X/SKS8300-12X is 192.168.10.12, with the default login account admin and the default login password admin.
2. First, we use a network cable to connect from the network port of the computer to any port of the switch (this switch requires a **MODULE**), which defaults in a vlan 1. If the connected port signal light flashes normally, go to step 3. If the port signal light is not on, force the port rate (see SKS8300-8X/SKS8300-12X forced port rate tutorial for details), and proceed to step 3.
3. The ip of the computer is static ip, the ip address is 192.168.10.100, and the subnet mask is 255.255.255.0. (Of course, the computer network card ip as long as 192.168.10.X, the range of X from 1-254, I only take 192.168.10.100 as an example).

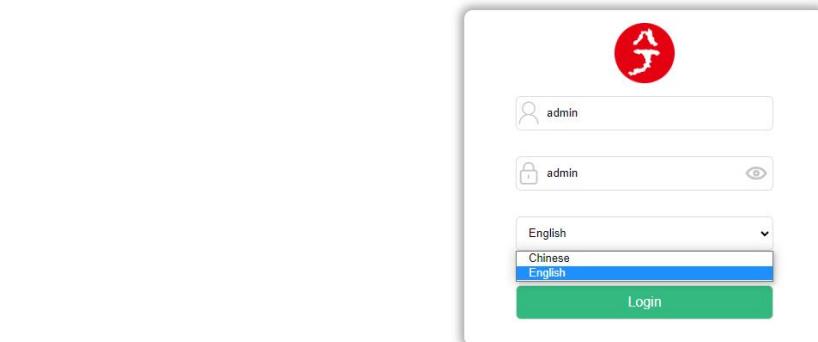

4. We open a web page, enter 192.168.10.12 in the url, and enter the default account number and password admin / admin. Enter into the interface of

the light management switch.

## 3. IP Config

### 3.1 IPv4 Config

The default VLAN001 is static IP and the address is 192.168.10.12

To change or add IP, you need to choose the VLAN interface name (the default is only VLAN001, and other ports need to be added by yourself), obtain the IP in static IP or dynamic acquisition, add the corresponding IP and subnet mask, add, click application, and save (top right corner of the page). Delete IP as the corresponding row, click delete. Note: The IP addresses of a different VLAN cannot be changed to the same network segment.

Collapse

### IPv4 Config

VLAN Interface	VLAN0001
IP Mode	Static IP
IP Address	<input type="text" value="Example:10.10.10.1"/>
Netmask	<input type="text" value="Example:255.255.255.0"/>

**Apply**

Showing 10 Entries      Showing 1 to 1 of 1 entries      Search:

	VLAN Interface	IP Mode	IP Address	Netmask
<input type="checkbox"/>	VLAN0001	Static IP	192.168.10.12	255.255.255.0

**Delete**      First Previous 1 Next Last

For example, the IP of VLAN002 is set to be dynamic acquisition, the IP of VLAN003 is set to be 10.0.0.40, and the subnet mask is 255.255.255.0

<input type="checkbox"/>	VLAN0003	Static IP	10.0.0.40	255.255.255.0

**Delete**      First Previous 1 Next Last

### 3.2 IPv6 Config

The IPv6 address of the system default VLAN001 is fe80::86e5:d8ff:fee0:44c4/64.

To change or add an IP, you need to choose the VLAN interface name (only VLAN001 by default, other ports need to be added by themselves), and then the IPv6 address, and prefix length, click Apply, and save. Delete IP as the corresponding row, click delete.

Collapse

### IPv6 Config

VLAN Interface	VLAN0001

#### 4. Web Config

##### 4.1 Web Timeout

web login timeout time, the system default time is 10 minutes, can be modified to 1-60 minutes, modify and click apply, and save.

Login Timeout

Login Timeout	10	(1-60 minutes)
---------------	----	----------------

**Apply**

For example, the modified login timeout is 23 minutes

Login Timeout

Login Timeout	23	(1-60 minutes)
---------------	----	----------------

**Apply**

##### 4.2 HTTP

The HTTP server configuration module that can be used to start or stop the HTTP service for the switch. The default is On, which can be modified according to the requirements.

Note that the HTTP service cannot be closed when logging in through HTTP mode. It can only be closed in other login modes. For example, when logging in through HTTPS mode, the HTTP service can be closed and saved. The default login mode of this manual is HTTP service. After the switch is directly closed, however, it is not saved, it can be directly cut off power, and then re-access the power supply, you can log in the background of the switch again through HTTP.

HTTP Server Config

HTTP Server Status	On
--------------------	----

##### 4.3 HTTPS

HTTPS Server configuration module which to start or stop the HTTPS service of the switch. The default is On, which can be modified according to the requirements. Note that HTTPS service cannot be closed when logging in through HTTPS mode. It can only be closed in other login modes. For example, when logging in through HTTP mode, HTTPS service can be closed and saved.

When HTTPS status is on, you can configure HTTPS, save the protocol port number (1025-65535,

the default is 443), and select the encryption type aes256-sha or ecdhe-rsa-aes256-sha.

Collapse

**HTTPS Config**

HTTPS Status	<input checked="" type="button"/> On
HTTPS Protocol Port	443 <small>(1025-65535, default 443)</small>
Encryption Type	<input type="radio"/> aes256-sha <input type="radio"/> ecdhe-rsa-aes256-sha <input checked="" type="radio"/> all

Apply

#### 4.4 Security IP

Set the secure IP address, and the IPv4 address outside the list cannot access the web interface. For example, set the security IP address 192.168.10.100 (the computer IP address we originally modified)

Collapse

**Login User Security IP Set**

To configure the trusted IP address for Telnet and SSH and HTTP/HTTPS login method

Security IP Address	<input type="text"/> Example:10.10.10.1
---------------------	---

Apply

<input type="checkbox"/>	No.	Login user Security IPv4 List
<input type="checkbox"/>	1	192.168.10.100

Delete

#### 4.5 ACL(Access Control)

Control the access control list (configured in ACL), which can be added or deleted.

Collapse

**Login Access Control List Set**

Configure standard IP ACL protocol binding through Telnet/SSH/Web login

Access Control List	<input type="text"/> (1-64 string or number 1-299)
Binding Method	Web

Apply

Access Control List	Binding Method
---------------------	----------------

Delete

### 5. User Management

#### 5.1 User Management

Add the user can edit the user name (1-32 characters) and set the user password (check the hidden text if necessary)

For example, add user ceshi, password 123456, priority 14

Collapse

### User Management

Username	<input type="text"/>	(1-32 characters)
Password	<input type="password"/>	Encrypted Text (Plain Text:1-32 characters)
Priority	<input type="text"/>	(number 1-15)

**Apply**

No.	Username	Password	State	Priority
1	ceshi	123456	Plain Text	14
2	admin	admin	Plain Text	15

**Delete**

### WEB Privilege Config

Login Privilege Enable	Disabled
Privilege Priority	15

**Apply**

## 5.2 Authentication Method

Three login methods can be configured: console (management port) / vty (virtual machine) / web (web page). The authentication method can be either or combination of Local (local), radius (remote dial) and tacacs (terminal access control access control system). Local is generally local account and password login authentication method. radius and tacacs authentication method can only be used after corresponding configuration. The default login authentication method of the system is local.

Collapse

### User Login Authentication Method Configure

Login Method	Console
Authentication Method1	Console
Authentication Method2	None
Authentication Method3	None
Operation Type	Configuration

**Apply**

Login Method	Authentication Method1	Authentication Method2	Authentication Method3
console	local	None	None
vty	local	None	None
web	local	None	None

Collapse

### User Login Authentication Method Configure

Login Method	Console
Authentication Method1	None
Authentication Method2	None
Authentication Method3	Local
Operation Type	Configuration

**Apply**

Login Method	Authentication Method1	Authentication Method2	Authentication Method3
console	local	None	None
vty	local	None	None
web	local	None	None

## 6. Firmware Upgrade

### 6.1 HTTP Upgrade

Through the upgrade package locally, select the corresponding img file for firmware upgrade.

Collapse

**Local Upgrade**

**Select File**

Decompress the package and select the img file for upgrade.

## 6.2 TFTP Service

Here, files can be uploaded or downloaded through TFTP, and the firmware of the switch can be upgraded in this way.

Collapse

**TFTP Service**

Server IP Address	Example:10.10.10.1
Server File Name	1-100 characters, Example: nos.img
Operation Type	Upload
Transmission Type	binary

**Apply**

## 6.3 FTP Service

Here you can upload or download files through FTP, and the firmware of the switch can be upgraded in this way.

Collapse

**FTP Service**

Server IP Address	Example:10.10.10.1
Username	1-100 characters
Password	1-100 characters
Server File Name	1-100 characters, Example: nos.img
Operation Type	Upload
Transmission Type	binary

**Apply**

## 7. Management Config

### 7.1 TFTP

Here, you can import or export the system configuration through the TFTP mode, and operate according to the prompts.

Collapse

**Import Configuration**

Server IP Address	Example:10.10.10.1
Config File Name	1-100 characters, Example: startup.cfg
Transmission Type	binary

**Apply**

**Export Configuration**

Server IP Address	Example:10.10.10.1
File Type	Running Configuration
Config File Name	1-100 characters, Example: startup.cfg

**Apply**

### 7.2 HTTP

Here, you can import or export the system configuration through the HTTP mode, and operate

according to the prompts.

Collapse

**HTTP Upload or Download File**

Operation Type	Download <input type="button" value="▼"/>
File Type	Running Configuration <input type="button" value="▼"/>

## 8. NTP

### 8.1 NTP Config

Here, you can configure the NTP server accordingly, and follow the prompts.

Collapse

**NTP Global Config**

NTP Global Config <input checked="" type="button" value="On"/>	
--	--

**NTP Server Config**

Server Address	IP address type,for example:10.10.10.1
Version	Version Range:1-4
Key ID	Key ID Range:1-4294967295

Ethernet1/0/7		Enabled	fiber-auto	Link Down	Disabled	auto

## 1.2 Port 10G Mode

Here, a 10G mode (adaptive or forced rate) can be set. Generally, when the connection module is not communicating, the corresponding rate can be forced to the corresponding. For example, we force port 1-3, with a rate of 10G.
